Digital Thread

BLOCKCHAIN DEFINED

Blockchain in its simplest form is digital information divided into blocks and linked together in a public or private peer-to-peer network.

The database this creates is not managed by any one person. Instead, everyone in the network gets a copy of the entire database.

The old blocks are preserved forever while new blocks are irreversibly added. This makes it impossible to manipulate by faking documents, transactions and other information.

A SIMPLIFIED EXAMPLE OF HOW BLOCKCHAIN WORKS

U.S.A.

Chicago
New York
Houston

ENGLAND

London
Manchester
Birmingham

CHINA

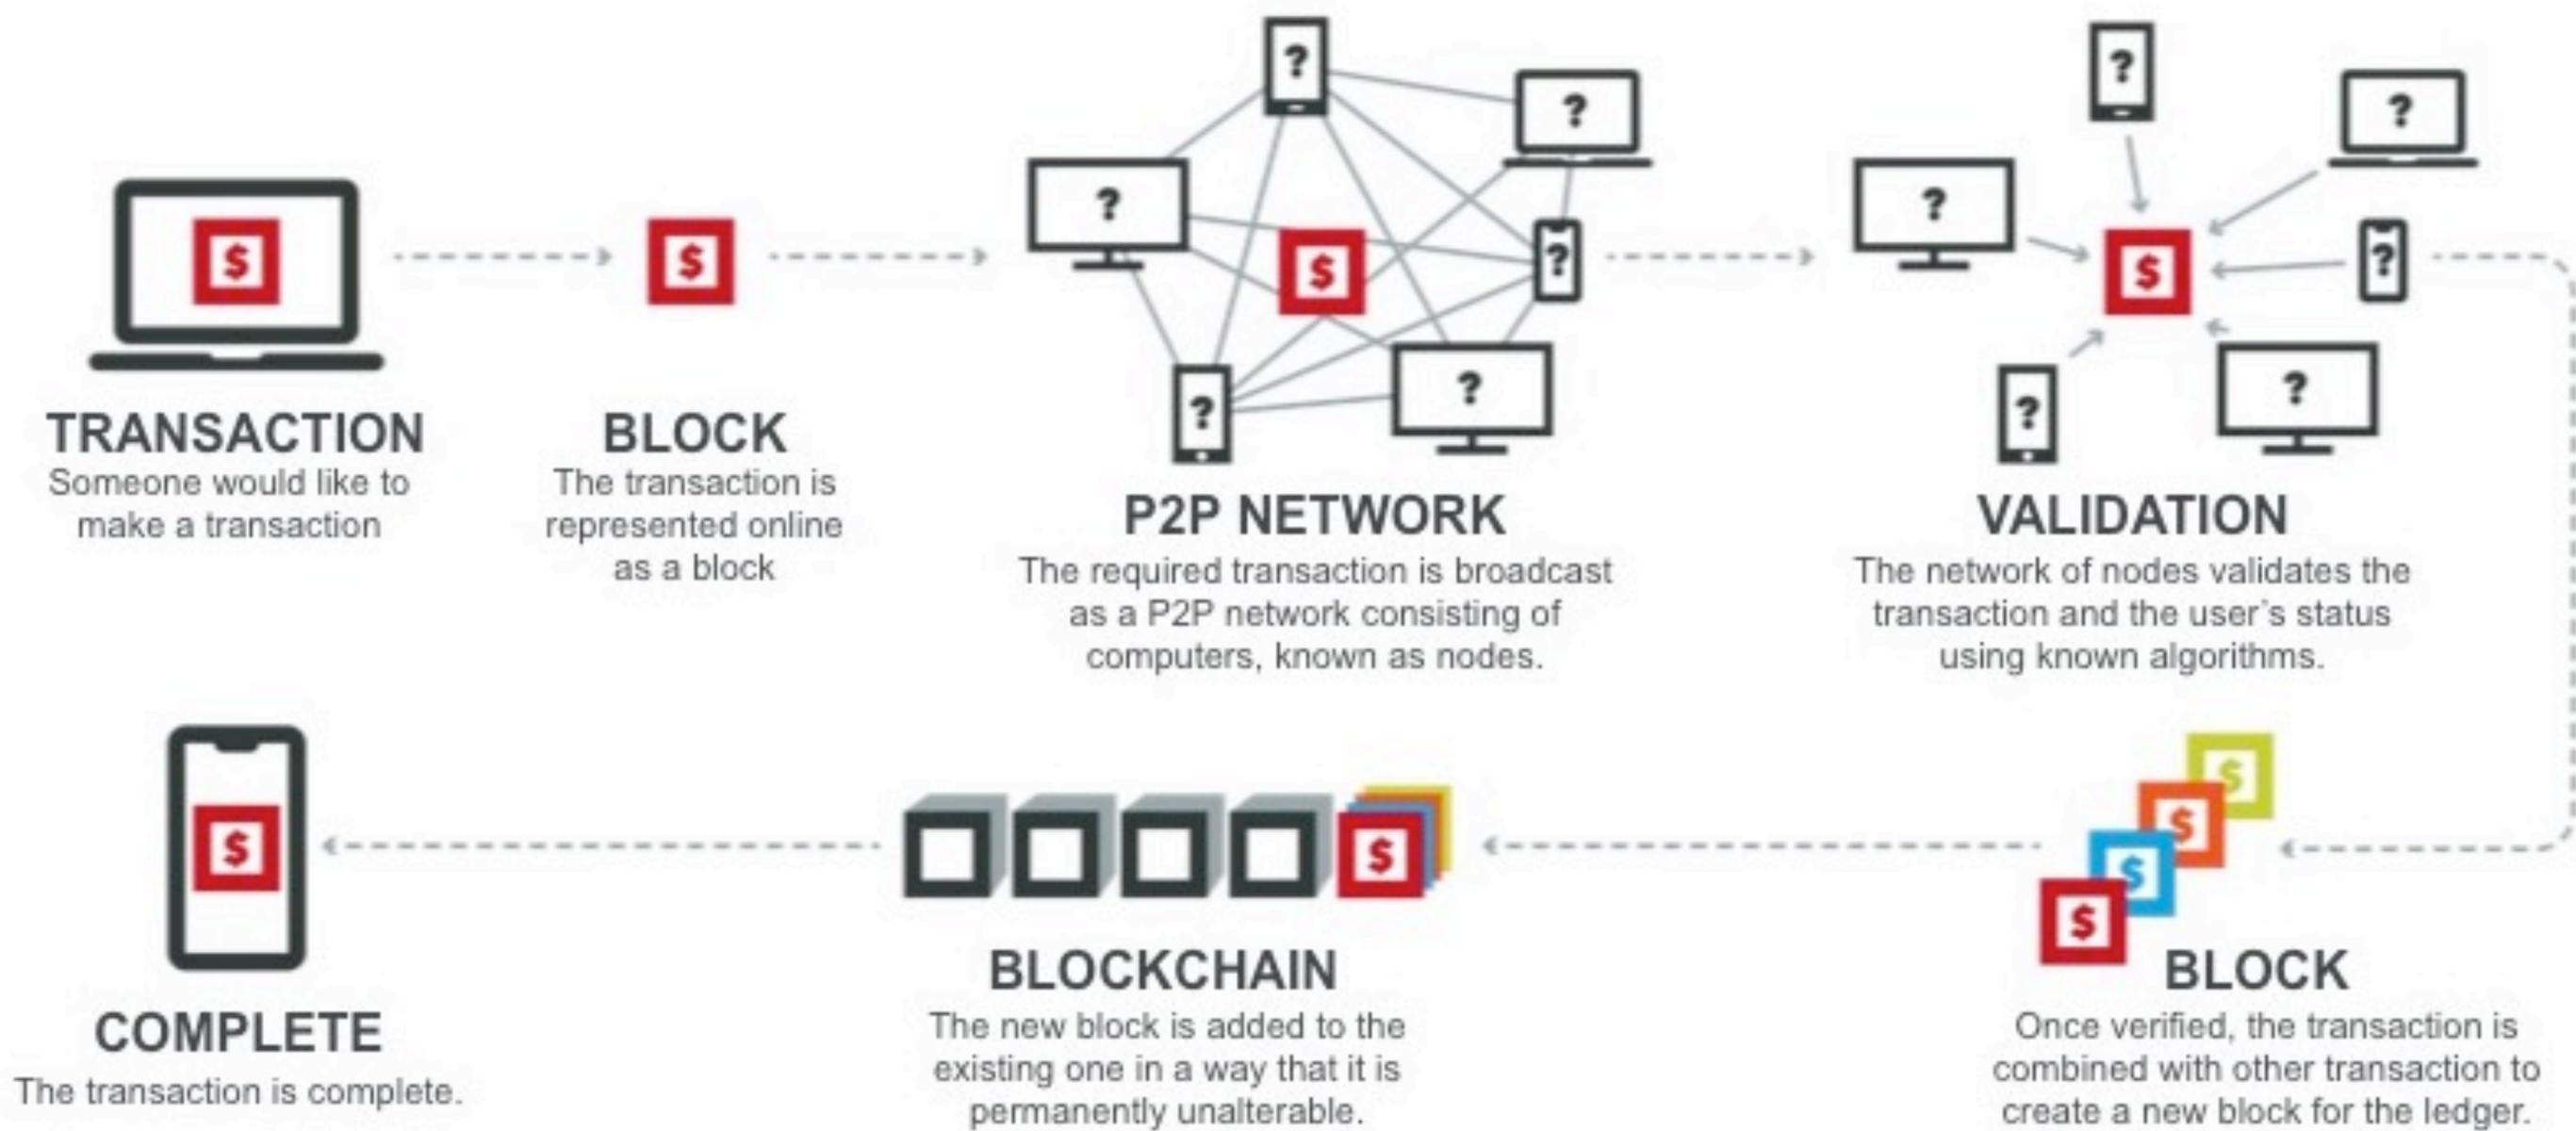

Beijing
Shanghai
Chendu

- Each linked data block represents a country.
- Contained inside each block are city names from that country.

- Each block contains a set of unique characters, derived from the information contained inside that block. This is called a hash.
- The USA block has the cities Chicago, New York, and Houston. For this example, the hash could be “CNYH”.
- Every successive block includes the previous block’s hash, binding the blocks together.

BLOCKCHAIN IS SECURE

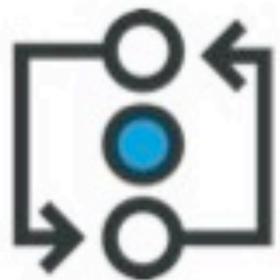

SMART CONTRACTS

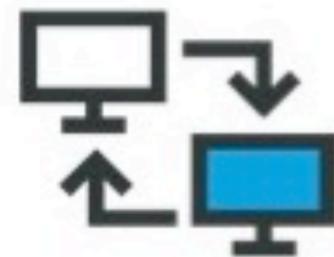

PRE-PROGRAMMED CONTRACT

The agreement rules and conditions are established by all parties and then coded

CHAIN OF EVENTS

If the events specified by the conditions happen, then the code automatically executes

EXECUTION AND VALUE TRANSFER

Once in process, the terms of the contract will automatically transfer the value to the correct parties

SETTLEMENT

The transfer of value to counterparties are recorded to the blockchain

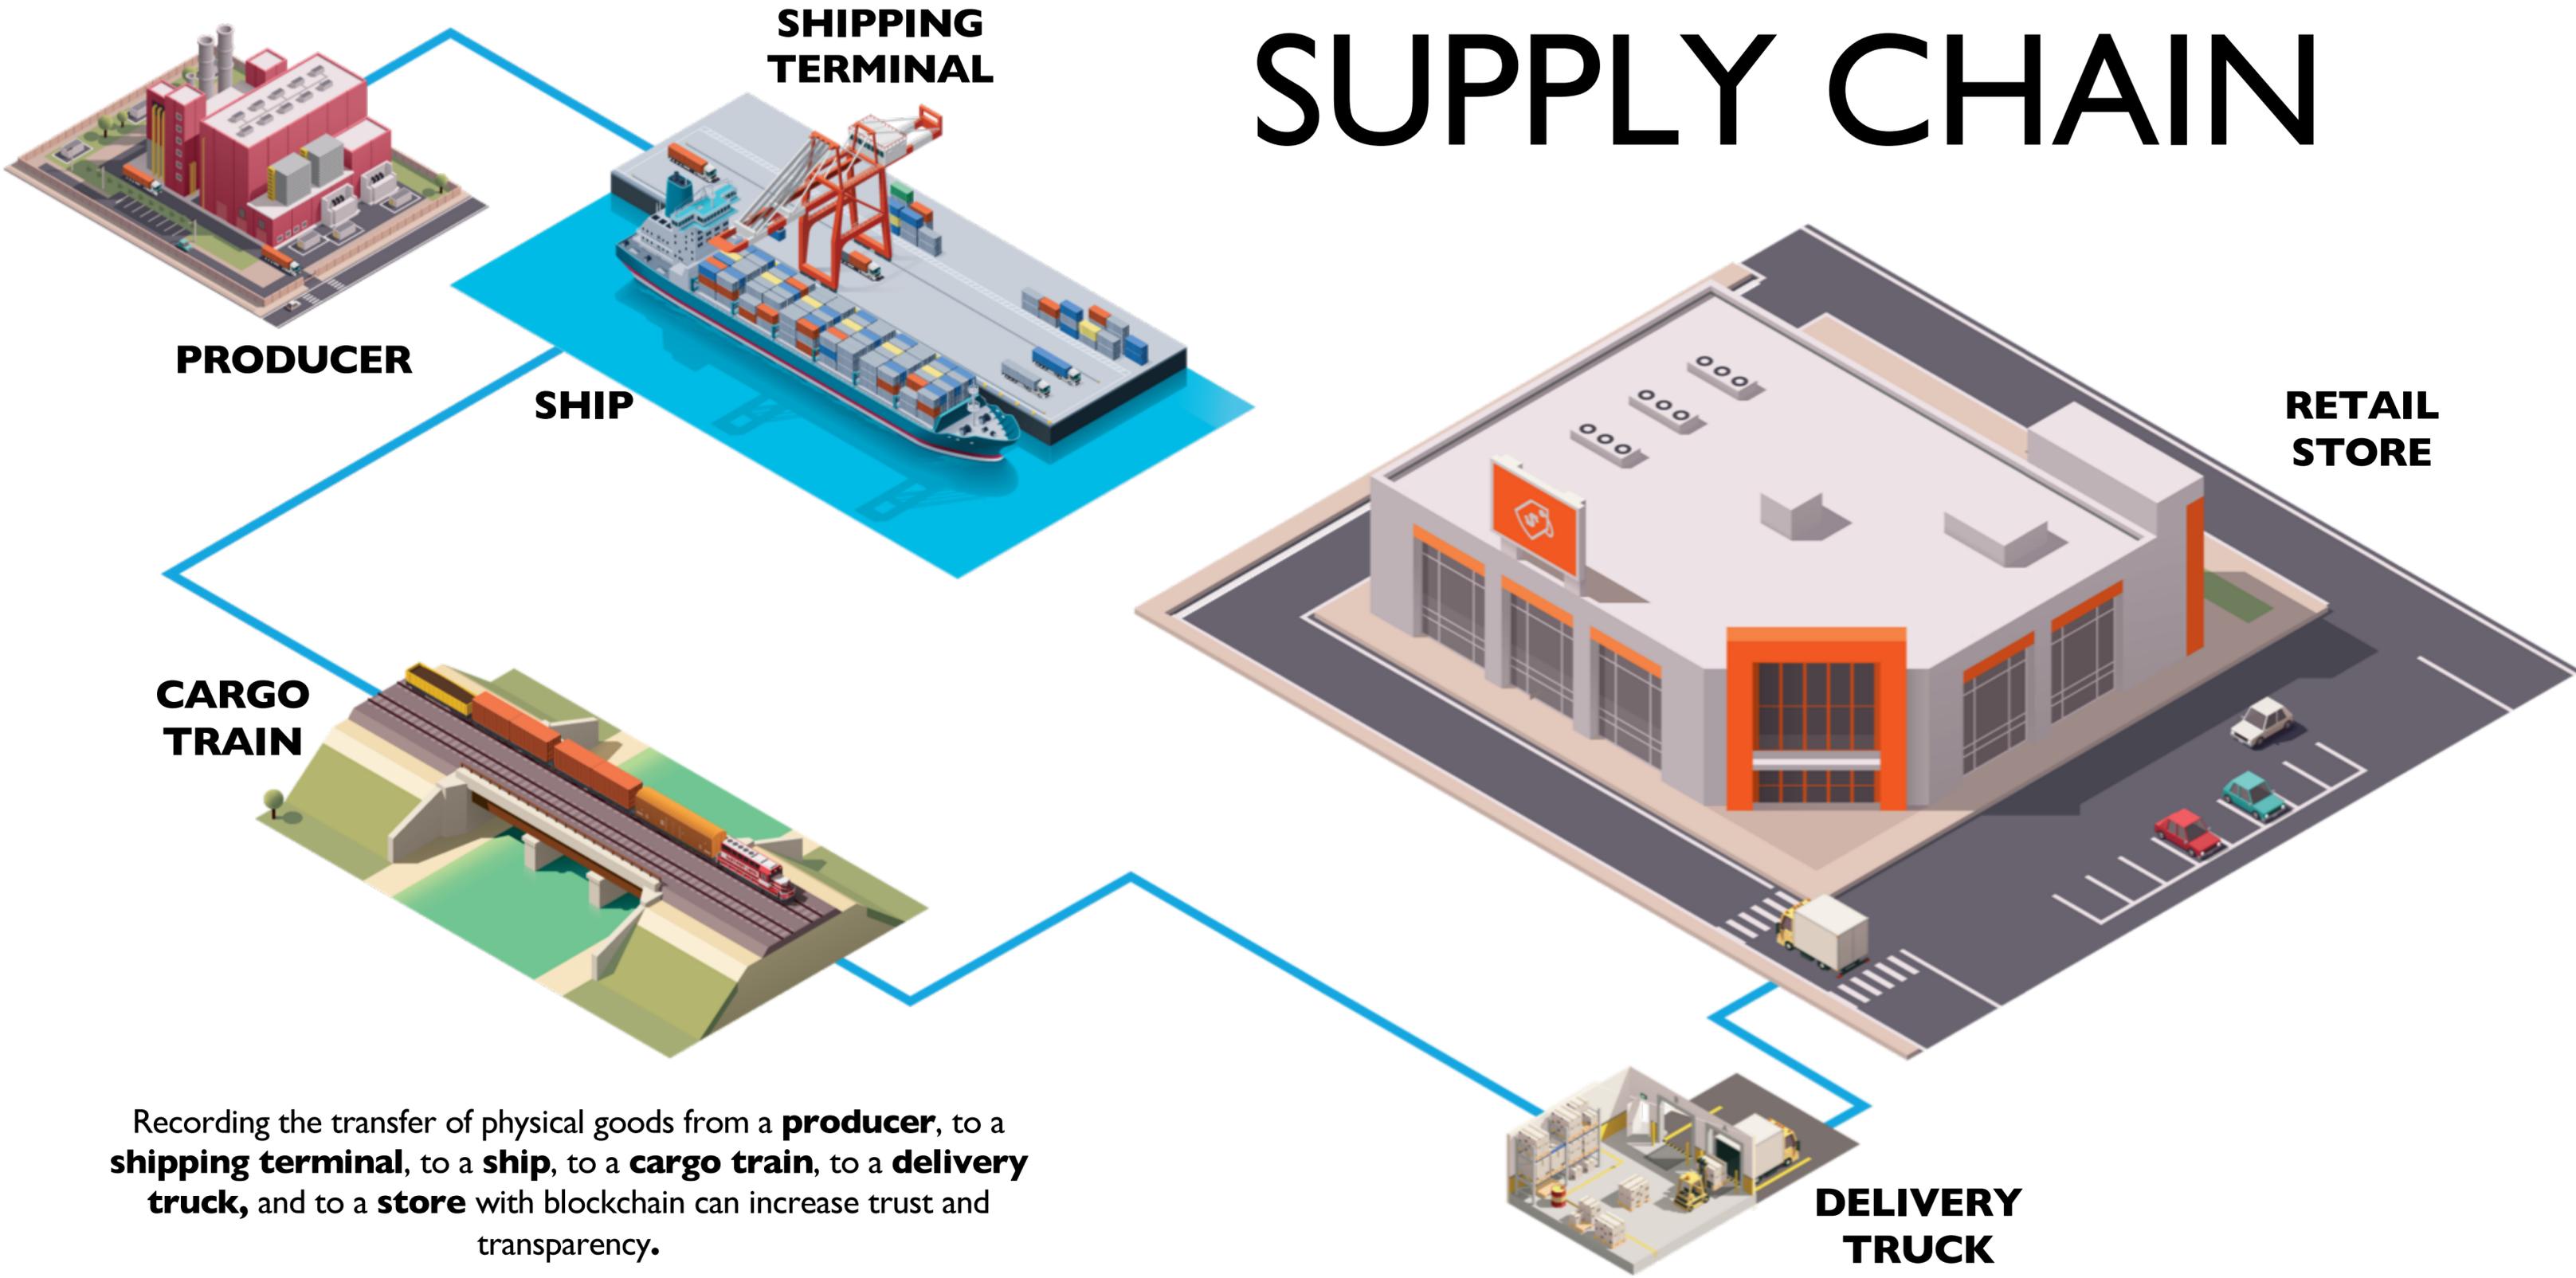

DAPPS

A DApp has its backend code (smart contract) running on a decentralized peer-to-peer network. The apps frontend (webapp) can be hosted on decentralized storage.

DAPP = FRONTEND + CONTRACTS

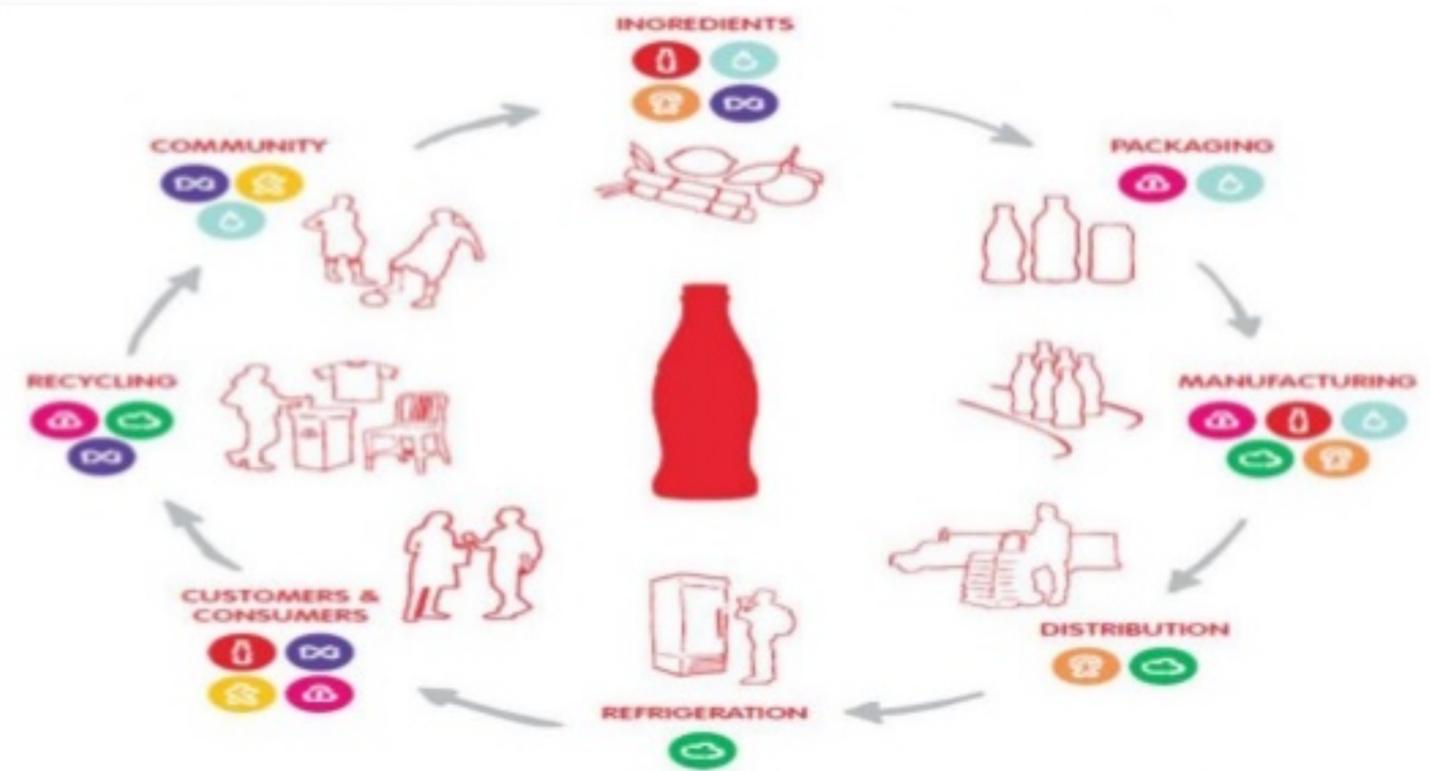

SUPPLY CHAIN

Recording the transfer of physical goods from a **producer**, to a **shipping terminal**, to a **ship**, to a **cargo train**, to a **delivery truck**, and to a **store** with blockchain can increase trust and transparency.

Coca-Cola®

“You will not find it difficult to prove that battles, campaigns, and even wars have been won or lost primarily because of logistics”

~ Dwight D.

Eisenhower

The Future of Manufacturing is Distributed,
Decentralized, Agile, and Rural
